**What does the restriction to 3 or 10 VINs mean?
Does this restriction only apply for one day?
What happens if I scrap or sell my vehicle?**

The restriction applies **permanently** to 3 or 10 **vehicle identification numbers** (= VINs) per interface for workshop operations.

Auto-scan, viewing measured values, reading and clearing fault memory do **not** “consume” a VIN.

Coding, adaptation, login, service reset, etc. – i.e., workshop operations – **do consume** a VIN.

If the 3 or 10 VINs are “full”, workshop operations can only be performed on the VINs registered up to that point.

Ten VINs should be more than sufficient for private use – who even has 10 cars? Even if you own 5, you can still perform coding, etc. on 5 other vehicles, and you can read fault memory from control units on any number of vehicles.

For anyone who performs service/workshop operations on more than 10 vehicles, the **unlimited product variant** is available. The respective product variant can be selected at the bottom left of the product description in the shop.

It is also possible to subsequently enable more VINs on the HEX-V2 or HEX-NET:
